

Woertz FE180 3 hour Fire Safety Cables and junction boxes

Selection Criteria:

It is important to select the proper cable for the application. A fire protection design is critical in the case where the cabling system has to meet stringent safety standards.

The Woertz Safety cables only burn close to the ignition source and prevents the spread of fire.

Features include:

- Low fire load
- Low heat conductivity (**IEC60332-1/EN 60332-1**), self-extinguishing: no flames are spread (**IEC 60332-1/EN 60332-1**)
- Halogen-free: no corrosive gases emitted. No corrosive elements will form in combination with extinguishing water (**IEC 60754-2/EN50267**)
- Low smoke emission, visibility not reduced (**IEC61034/EN 50268**)
- Cable structure: **DIN VDE 250-214 and DIN VDE 0281**
- The modular system is waterproof and meets **IP66/68 standards**

Fire and its effects are very unpredictable and 100% safety cannot be guaranteed. Testing only covers about 95% of the cases which may occur and enable comparative values to be obtained in order to determine different levels of safety.

Insulation integrity FE

The basic test (according to IEC 60331) is designed to stress the insulation of a cable by submitting it to flame temperature of at least 750°C (1,382 °F) – test length 50cm (~ 20 inches).

If electrical current flows for 180 minutes and no short-circuit occurs, the circuit integrity of the cable is classified as FE 180 (FE = effect of fire or flame)

Function integrity E

Testing the function integrity requires measuring the duration which current continues feeding life safety equipment such as emergency lighting, smoke extraction systems, alarms and exit signs.

The function integrity indicates the duration which the installation should continue to function in the event of a fire. This applies to the entire installation, cables, boxes, wire duct and fasteners. Function integrity is designated by the

letter E together with a number. E 90 means that the installation will continue to function for 90 minutes without short-circuits and no voltage failure.

Woertz Fire Safety also conforms to the following standards:

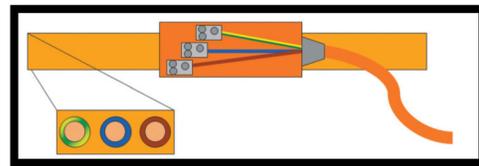

Features of the cable system	Standards
Insulation integrity FE 180	IEC 60331-11/-21 (180 minutes)
Function integrity E30 to E90	DIN 4102 part 12

The Modular Solution

Woertz® flat cable systems comprise of the following modules:

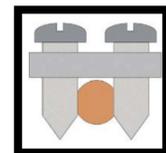

- **Woertz® FE 180 Safety cable**

- Ceramically insulated and have an insulation integrity of 180 minutes
- The distance from core to core has been accurately calculated so **NO ADVERTENT CONTACT and NO SHORT-CIRCUIT** will occur between individual wires, even if the sheath is completely damaged by burning.
- As wires in the flat cable run parallel, they will not cross or superimpose.
- A **rodent repellent** has been incorporated into the cable sheath.

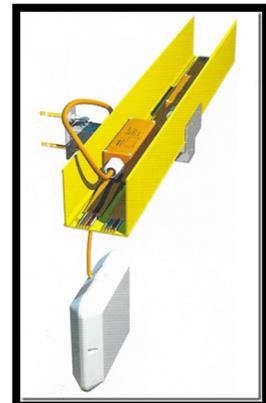

- **Woertz® branching and feeding box**

- External casing meets IP66/68 protection rating standards (protected against powerful jets of water and continuous submersion in water.)
- The metal parts inside the box are separated by **ceramic insulation** and a metal frame maintains structural stability
- The wires in the flat cable run parallel and facilitate easy access to the individual wires via junction boxes that can be placed anywhere using the Woertz piercing® method that does not require stripping.
- The asymmetric profile of the cable ensures that the boxes can only be mounted in a specific position, so that all wires and connections are automatically placed correctly.
- Woertz utilizes DOUBLE INSULATION PIERCING CLAMPING units. Two pointed screws and a metal bar firmly clamp and maintain each core.
- **The contact will be maintained even if the insulation and other layers are damaged in a fire.**

- **For addition protection, Wire duct and fasteners are available**

- Cable duct s are made of glass fiber-reinforced polyester resin (halogen-free) and provided with fire-proof fabric tape. They are protected by a dust-proof cover.
- Ducts should be installed with the fasteners provided by Woertz.

Mounting procedure of connecting box No. 48253/L/68/E90

(may be used for both feeding and branching)

Remove the cover plate of the box. The cable gland has to be prepared and mounted on the branching cable (round cable). Cut the latter to the desired length and dismantle it. Introduce the stripped leads.

1

Tighten up the 3 screws. Once the O-ring positions correctly in the cable gland, tighten up the latter.

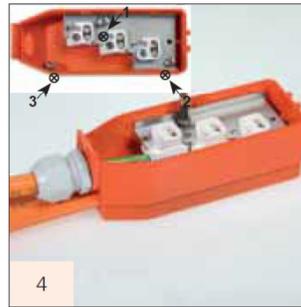

No.1
0.7Nm
6.2lb-in

2

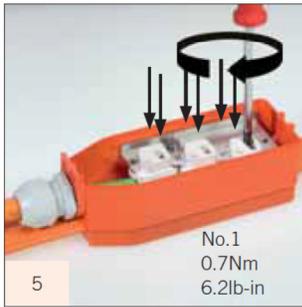

Position the fl at cable in the right position. The lug in the base acts as a reference point. It has to match the lug of the fl at cable. In case of incorrect mounting the box cannot be fitted with normal force. The cable must be cleaned, gel and oil must be removed.

3

Snap together the upper part and the base. Tighten up the 3 fastening screws of the base.

4

Tighten up the 6 piercing screws (Twin-Piercing) in order to establish contact with the fl at cable cores.

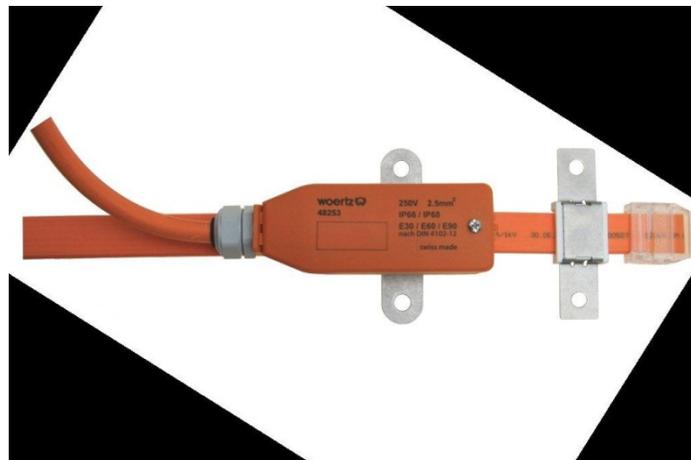

No.1
0.7Nm
6.2lb-in

5

Replace the cover plate carefully and tighten up the screws. The box may be marked if necessary.

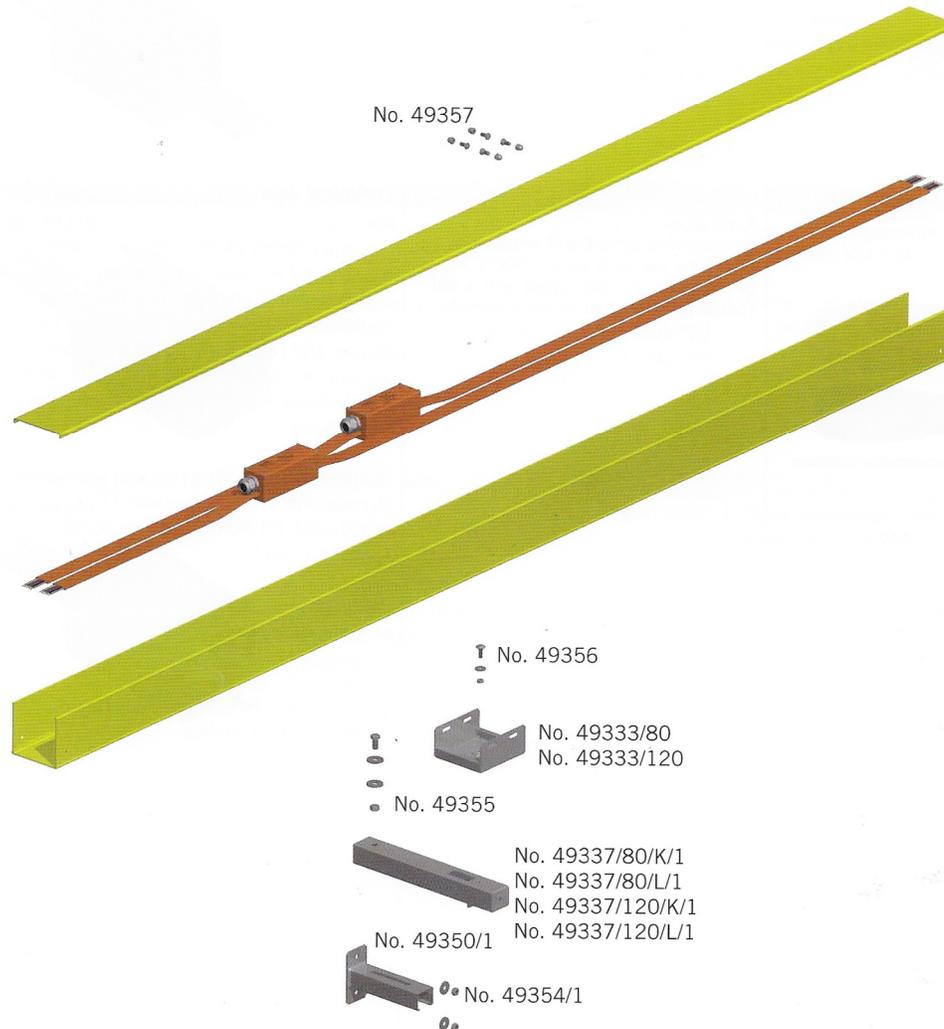

6

Building Installation Picture:

For London underground the requirement for circuit integrity was EN50200 and BS8434-2 but not DIN4102.

For EN50200 we attained PH120 this test is a cable test.

An also BS8434-2 (930°C 60min (Fire +each 5min shock) + 60min (Fire +each 5min shock+ water) this test is a cable test

Junction box and the fuse module in the fire test BS8434-2
